### **Introduction**

Thank you for purchasing a MacWireless PCI USB Card. This card works with all computer models with an available PCI slot running Mac OS 8.6 and higher. For most computers, no software installation is necessary, as all the necessary drivers are included in the operating system. Please see below for instructions on how to set up your card.

### **Installation**

1. Turn your desktop Macintosh off.
2. Locate an available PCI card slot and remove the metal plate.
3. Holding the PCI card by its edges, insert it completely into the PCI slot and secure in place using the original screws. Confirm that the card is well seated and even in the PCI slot.
4. After closing the computer up, power on the computer.

### **Troubleshooting**

Please note that if you are installing this card on a computer running Mac OS 9, then your computer may not have the necessary USB drivers already installed. The drivers come with OS 9, but are not installed by default if your computer does not have USB ports built-in. If the card does not work after installation, then it may be necessary to update or re-install your OS in order to make the card work.
